DNS harvesting - uses OSINT to gather info about domain

- subdomains
- hosting provider
- admin contacts

topology discovery - on internetwork (net of routed subnets) attacker wants to discover how routers connect subnets + if any misconfig gateways between subnets exist

host discovery - like nmap

ping - id presense of host or IP

direct access attacks - stealing laptop ... and other physical laptop ... and

attacks

information sharing and analysis centers ISACs - share threat intel and promote best practices

Auto-ISAC is private sharing center

if set up under gov then it would be public sharing center

if from company like IBM it is closed or proprietary intel source
